9: Data Visualization

Environmental Data Analytics | Kateri Salk Spring 2019

LESSON OBJECTIVES

- 1. Perform simple data visualizations in the R package ggplot
- 2. Develop skills to adjust aesthetics and layers in graphs
- 3. Apply a decision tree framework for appropriate graphing methods

SET UP YOUR DATA ANALYSIS SESSION

```
getwd()
## [1] "/Users/ks501/Documents/GithubRepos/ENV872"
library(tidyverse)

PeterPaul.chem.nutrients <- read.csv("./Data/Processed/NTL-LTER_Lake_Chemistry_Nutrients_PeterPaul_Proc
PeterPaul.nutrients.gathered <- read.csv("./Data/Processed/NTL-LTER_Lake_Nutrients_PeterPaulGathered_Pr
PeterPaul.chem.nutrients.summaries <- read.csv("./Data/Processed/NTL-LTER_Lake_Summaries_PeterPaul_Proc
EPAair <- read.csv("./Data/Processed/EPAair_03PM25_3sites1718_processed.csv")

EPAair$Date <- as.Date(EPAair$Date, format = "%Y-%m-%d")
PeterPaul.chem.nutrients$sampledate <- as.Date(PeterPaul.chem.nutrients$sampledate, format = "%Y-%m-%d")</pre>
```

GGPLOT

ggplot, called from the package ggplot2, is a graphing and image generation tool in R. This package is part of tidyverse. While base R has graphing capabilities, ggplot has the capacity for a wider range and more sophisticated options for graphing. ggplot has only a few rules:

- The first line of ggplot code always starts with ggplot()
- A data frame must be specified within the ggplot() function. Additional datasets can be specified in subsequent layers.
- Aesthetics must be specified, most commonly x and y variables but including others. Aesthetics can be specified in the ggplot() function or in subsequent layers.
- Additional layers must be specified to fill the plot.

Geoms

Here are some commonly used layers for plotting in ggplot:

- \bullet geom_bar
- geom_histogram
- geom freqpoly
- geom_boxplot
- geom violin
- geom_dotplot

- \bullet geom_point
- \bullet geom_errorbar
- geom_smooth
- \bullet geom_line
- \bullet geom_area
- geom_abline (plus geom_hline and geom_vline)
- geom_text

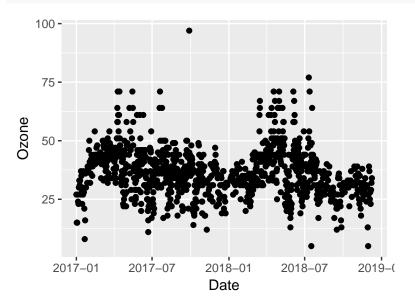

Aesthetics

Here are some commonly used aesthetic types that can be manipulated in ggplot:

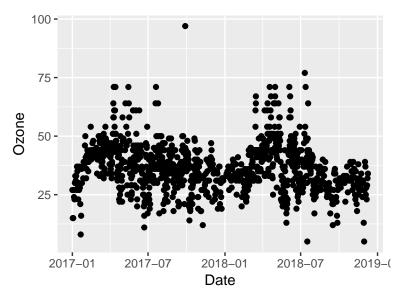

- \bullet color
- fill
- shape
- size
- transparency

Plotting continuous variables over time: Scatterplot

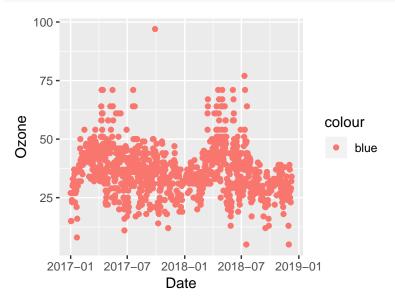

```
# Scatterplot
ggplot(EPAair, aes(x = Date, y = Ozone)) +
geom_point()
```

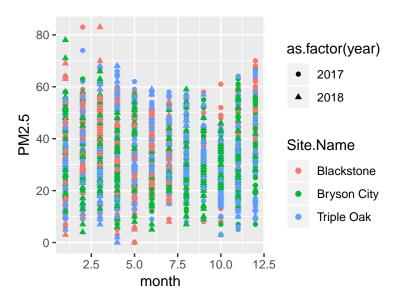

```
O3plot <- ggplot(EPAair) +
  geom_point(aes(x = Date, y = Ozone))
print(O3plot)</pre>
```

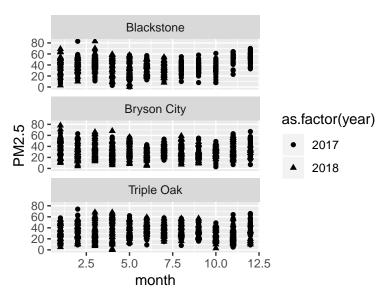

```
# Fix this code
03plot2 <- ggplot(EPAair) +
  geom_point(aes(x = Date, y = Ozone, color = "blue"))
print(03plot2)</pre>
```

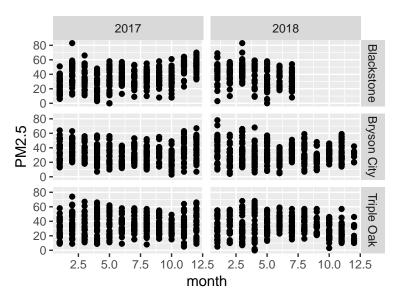

```
# Add additional variables
PMplot <-
    ggplot(EPAair, aes(x = month, y = PM2.5, shape = as.factor(year), color = Site.Name)) +
    geom_point()
print(PMplot)</pre>
```

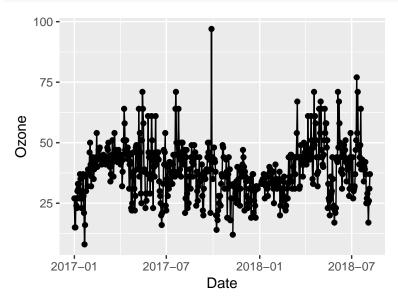

```
# Separate plot with facets
PMplot.faceted <-
    ggplot(EPAair, aes(x = month, y = PM2.5, shape = as.factor(year))) +
   geom_point() +
   facet_wrap(vars(Site.Name), nrow = 3)
print(PMplot.faceted)</pre>
```

```
PMplot.faceted2 <-
    ggplot(EPAair, aes(x = month, y = PM2.5)) +
    geom_point() +
    facet_grid(Site.Name ~ year)
print(PMplot.faceted2)</pre>
```

```
# Filter dataset within plot building
03plot.Blackstone <-
    ggplot(subset(EPAair, Site.Name == "Blackstone"), aes(x = Date, y = Ozone)) +
    geom_point() +
    geom_line() =
    print(03plot.Blackstone)</pre>
```

```
# Exercise: build your own scatterplots of PeterPaul.chem.nutrients

# 1.

# Plot surface temperatures by day of year.

# Color your points by year, and facet by lake in two rows.

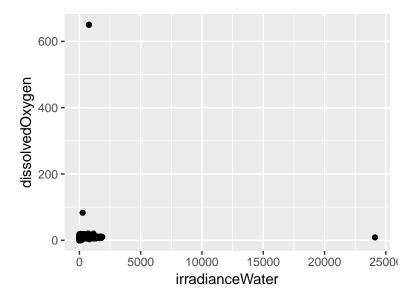

#2.

# Plot temperature by date. Color your points by depth.

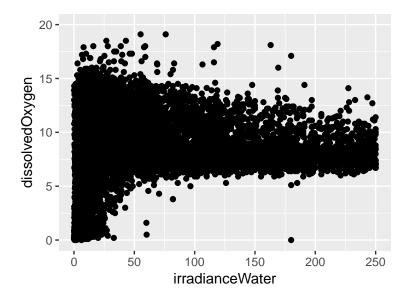

# Change the size of your point to 0.5
```

Plotting the relationship between two continuous variables: Scatterplot

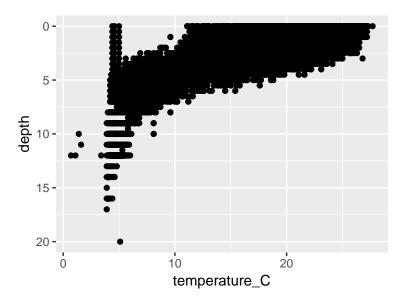

```
# Scatterplot
lightvsD0 <-
ggplot(PeterPaul.chem.nutrients, aes(x = irradianceWater, y = dissolvedOxygen)) +
geom_point()
print(lightvsD0)</pre>
```

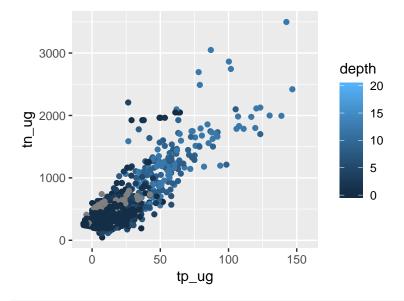

```
# Adjust axes
lightvsDOfixed <-
    ggplot(PeterPaul.chem.nutrients, aes(x = irradianceWater, y = dissolvedOxygen)) +
    geom_point() +
    xlim(0, 250) +
    ylim(0, 20)
print(lightvsDOfixed)</pre>
```

```
# Depth in the fields of limnology and oceanography is on a reverse scale
tempvsdepth <-
    ggplot(PeterPaul.chem.nutrients, aes(x = temperature_C, y = depth)) +
    #ggplot(PeterPaul.chem.nutrients, aes(x = temperature_C, y = depth, color = daynum)) +
    geom_point() +
    scale_y_reverse()
print(tempvsdepth)</pre>
```

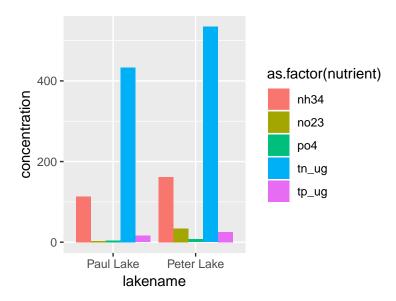

```
NvsP <-
    ggplot(PeterPaul.chem.nutrients, aes(x = tp_ug, y = tn_ug, color = depth)) +
    geom_point() #+
    #geom_smooth(method = lm) +
    #geom_abline(aes(slope = 16, intercept = 0))
print(NvsP)</pre>
```

 ${\it\# Exercise: Plot relationships between air quality measurements}$

```
# 1.
# Plot AQI values for ozone by PM2.5, colored by site.
# Add a line of best fit for the linear regression of these variables.
```

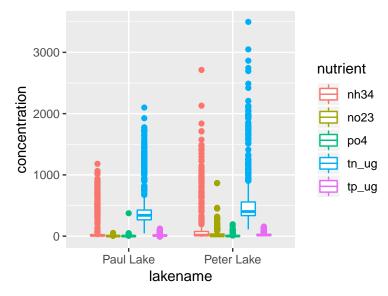

Plotting continuous vs. categorical variables

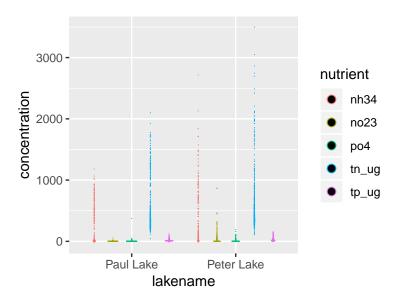

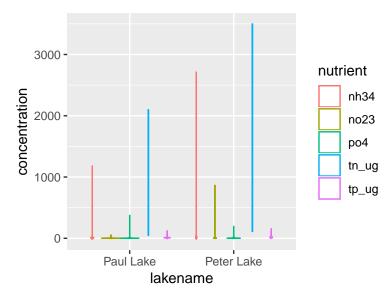

```
# Are there more effective ways to produce summary stats for categories?

# Box and whiskers plot
Nutrientplot3 <-
ggplot(PeterPaul.nutrients.gathered, aes(x = lakename, y = concentration)) +
geom_boxplot(aes(color = nutrient)) # Why didn't we use "fill"?
print(Nutrientplot3)</pre>
```

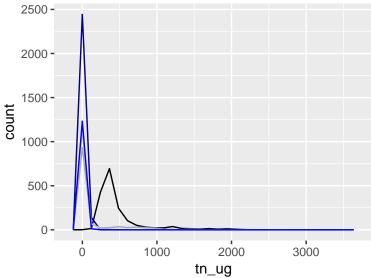

```
# Violin plot
Nutrientplot5 <-
    ggplot(PeterPaul.nutrients.gathered, aes(x = lakename, y = concentration)) +
    geom_violin(aes(color = nutrient)) #
print(Nutrientplot5)</pre>
```

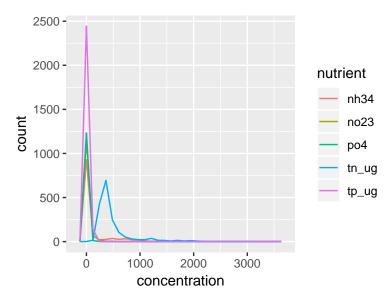

```
# Frequency polygons
# Using a tidy dataset
Nutrientplot6 <-
    ggplot(PeterPaul.chem.nutrients) +
    geom_freqpoly(aes(x = tn_ug), color = "black") +
    geom_freqpoly(aes(x = tp_ug), color = "darkblue") +
    geom_freqpoly(aes(x = nh34), color = "darkgray") +
    geom_freqpoly(aes(x = no23), color = "gray") +
    geom_freqpoly(aes(x = po4), color = "blue")
print(Nutrientplot6)</pre>
```

```
## `stat_bin()` using `bins = 30`. Pick better value with `binwidth`.
## `stat_bin()` using `bins = 30`. Pick better value with `binwidth`.
## `stat_bin()` using `bins = 30`. Pick better value with `binwidth`.
## `stat_bin()` using `bins = 30`. Pick better value with `binwidth`.
## `stat_bin()` using `bins = 30`. Pick better value with `binwidth`.
```

```
# Using a gathered dataset
Nutrientplot7 <-
    ggplot(PeterPaul.nutrients.gathered) +
    geom_freqpoly(aes(x = concentration, color = nutrient))
print(Nutrientplot7)</pre>
```

`stat_bin()` using `bins = 30`. Pick better value with `binwidth`.

```
# Exercise: Plot distributions of AQI values for EPAair
# 1.
# Create a bar chart plus standard deviation error bars for PM2.5, divided by year.
```

```
# Create separate bars for each site.
# 2.
# Create a new plot that better depicts the distribution of PM2.5 concentrations.
# Divide your graph by year and site.
```
